ENTIAL

### 1. Sensor Overview

### 1.1 General Description

The GC0328 features 640V x 480H resolution with 1/6.5-inch optical format, and 4-transistorpixel structure for high image quality and low noise variations. It delivers superior image quality by powerful on-chip design of a 10-bit ADC, and embedded image signal processor.

The full scale integration of high-performance and low-power functions makes the GC0328 fit the design, reduce implementation process, and extend the battery life of cell phones, PDAs, and a wide variety of mobile applications.

The product is capable of operating at up to 30 fps at 24MHZ clock in VGA mode, which can be completely controlled by user over image quality and data format.

#### 1.2 Features

- ◆ Standard optical format of 1/6.5 inch
- ◆ Various output formats: YCbCr4:2:2, RGB565, Raw Bayer
- Support adjusting Voltage of IO
- ◆ Windowing support
- ♦ Horizontal /Vertical mirror
- ◆ Image processing module
- ◆ Package: CSP/wafer

GC0328 Datasheet 3 / 49

MIAL

### 1.3 Application

- Cellular Phone Cameras
- Notebook and desktop PC cameras
- ◆ PDAs
- **♦** Toys
- ◆ Digital still cameras and camcorders
- Video telephony and conferencing equipments
- Security systems
- Industrial and environmental systems

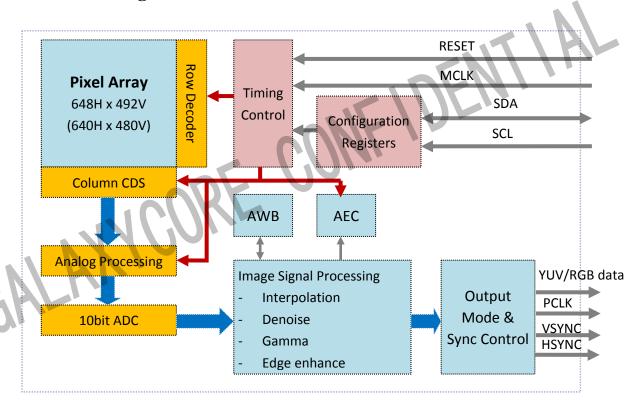

### 1.4 Technical Specifications

| Parameter                         | Typical value                           |
|-----------------------------------|---|
| Optical Format                    | 1/6.5 inch                              |
| Pixel Size                        | 3.4um x 3.4um                           |
| Active pixel array                | 648 x 488                               |
| ADC resolution                    | 10 bit ADC                              |
| Max Frame rate                    | 30fps@24Mhz,VGA                         |
| Power Supply                      | AVDD28: 2.7 ~ 3.0V<br>IOVDD: 1.7 ~ 3.0V |
| Power Consumption                 | 80mW @30fps VGA<br><25μA @standby       |
| SNR                               | TBD                                     |
| Dark Current                      | TBD                                     |
| Sensitivity                       | TBD                                     |
| Operating temperature:            | -20~70°C                                |
| Stable Image temperature          | 0~50℃                                   |
| Optimal lens chief ray angle(CRA) | 27°(linear)                             |
| Package type                      | CSP/Wafer                               |

GC0328 Datasheet 4 / 49

### 1.5 Block Diagram

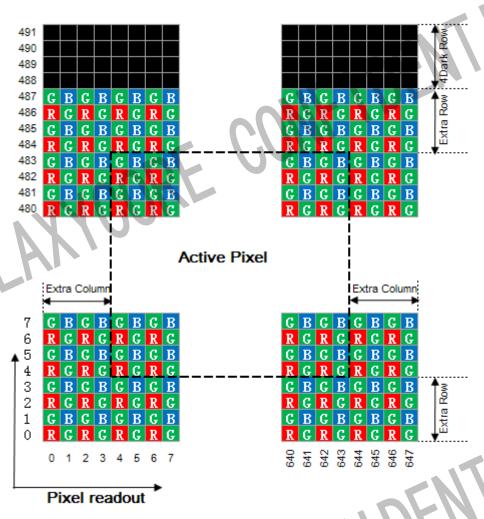

GC0328 has an active image array of 648x488 pixels. The active pixels are read out progressively through column/row driver circuits. In order to reduce fixed pattern noise, CDS circuits are adopted. The analog signal is transferred to digital signal by 10 bit A/D converter. The digital signals are processed in the ISP Block, including Bayer interpolation, denoise, and color correction, gamma correction, data format conversion and so on. Users can easily control these functions via two-wire serial interface bus.

GC0328 Datasheet 5 / **49** 

### 1.6 Pixel Array

Pixel array is covered by Bayer pattern color filters. The primary color BG/GR array is arranged in line-alternating way.

If no flip in column, column is readout from 0 to 647. If flip in column, column is read out from 647 to 0.

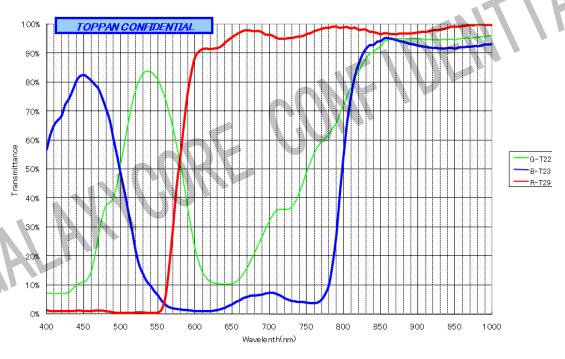

If no flip in row, row is readout from 0 to 487. If flip in row, row is read out from 487 to 0.

GC0328 Datasheet 6 / 49

### 2. Color Filter Spectral Characteristics

The optical spectrum of color filters is shown below:

### 3. Two-wire Serial Bus Communication

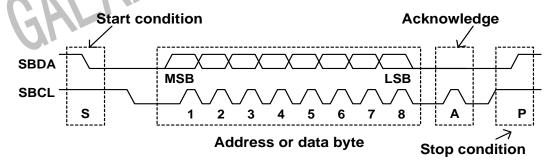

GC0328 Device Address:

serial bus write address = 0x42H, serial bus read address = 0x43H

### 3.1 Protocol

The host must perform the role of a communications master and GC0328 acts as either a slave receiver or transmitter. The master must do

- ♦ Generate the **Start(S)/Stop(P)** condition
- Provide the serial clock on SBCL.

GC0328 Datasheet 7 / 49

### **Single Register Writing:**

| Set-up time for a stop                              | tsu;sto | 1.2 | *   | μs | _1 |
| Capacitive load of bus line (SBCL, SBDA)            | Cb      | *   | *   | pf |    |
| <ul><li>4. Application</li><li>4.1 Timing</li></ul> | 301     | WF. | 1   | E  |    |

### 4. Application

#### 4.1 **Timing**

Suppose VSYNC is LOW active and HSYNC is HIGH active, and output format is YCbCr/RGB565, then the timing of VSYNC and HSYNC is shown below:

Ft = VB + Vt + 8 (unit is row\_time)

VB = Bt + St + Et, Vblank/Dummy line, setting by register P0:0x07 and P0:0x08.

Ft -> Frame time, one frame time.

Bt -> Blank time, VSYNC no active time.

St -> Start time, setting by register P0:0x12

Et  $\rightarrow$  End time, setting by register P0:0x13.

Vt -> valid line time. VGA is 480, Vt = win\_heigh t- 8, win\_height is setting by register P0:0x0d & P0:0x0e (488).

When exp\_time <= win\_height + VB, Bt=VB - St - Et. Frame rate is controlled by window\_height + VB.

When exp\_time > win\_height + VB, Bt=exp\_time - win\_height - St - Et. Frame rate is controlled by exp\_time.

#### The following is row\_time calculate:

 $row_time = Hb + Sh_delay + win_width + 4.$ 

Hb -> HBlank or dummy pixel, Setting by register P0:0x05 and P0:0x06.

9 / 49 GC0328 Datasheet

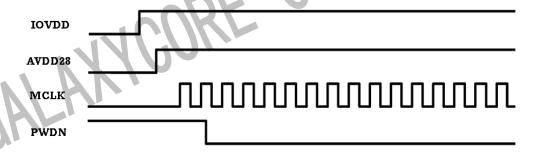

Sh\_delay -> Setting by register P0:0x11.

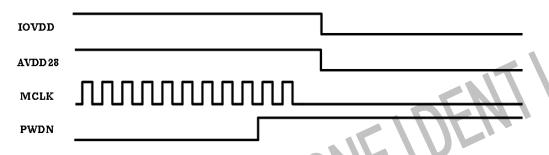

win\_width -> Setting by register P0:0x0f and P0:0x10, win\_width = 640, final\_output\_width + 8. So for VGA, we should set win\_width as 648.

### 4.2 Power on/off sequence

### 4.2.1 Power On Sequence

### 4.2.2 Power Off Sequence

### 5. DC Parameters

| Symbol   | Parame | eter                      | Min | Тур | Max | Unit |  |  |  |
